Re: Rust Engineer — [role / project]

Dear [Hiring Manager],

I build business systems in **Rust** that a company can actually run — one binary, one PostgreSQL, a complete audit trail, no build step and no per-seat SaaS bill. I'd like to bring that to **[Company]**.
[One specific sentence on why this company — the system they run, the problem they have, or what they're building.]

To prove the approach end to end, I authored **RustIO** — a Postgres-first admin framework for Rust ("Django Admin for Rust"), where authentication, sessions, role-based access, MFA, and a full audit trail are designed as one system rather than bolted on. I ship real products on it:

SystemKraft, a business-systems platform for Swedish enterprises served entirely from one Rust binary, and **Lursystem**, a self-hosted EU whistleblower-reporting system (*lag 2021:890*) where the data never leaves the employer's own server. Everything is written under a zero-unsafe policy and the strictest Clippy configuration.

For **[Company]** that means a smaller operational and attack surface than a multi-service web stack: internal admin and back-office systems that are audit-grade, memory-safe, and simple to deploy. I own systems end to end — data model to production — and I'd welcome the chance to discuss how I can help [Company] [specific goal].

Thank you for your time.

Sincerely,

Abdulwahed Mansour
