

# Abdulwahed Mansour

## Rust / Systems Engineer

Stockholm, Sweden · +46 76 930 8145 · [abdulwahed.mansour@gmail.com](mailto:abdulwahed.mansour@gmail.com)  
[github.com/abdulwahed-sweden](https://github.com/abdulwahed-sweden) · [linkedin.com/in/abdulwahed-sweden](https://linkedin.com/in/abdulwahed-sweden) · EU work eligibility · Stockholm / hybrid / remote

Covers: Rust Developer · Rust Engineer · Systems Engineer · Systems Architect · Performance Engineer

### SUMMARY

Systems engineer specializing in **Rust** for performance-critical, correctness-critical software. Author of 115K+ lines of production Rust across 18 projects — async services, forensic engines, security tooling, and on-chain bots — with a **zero unsafe** policy and the strictest Clippy configuration. I design for the hot path: zero-copy parsing, bounded resource usage, type-safe domain models, and predictable concurrency on Tokio. I also bridge Rust into Python via PyO3 to accelerate existing systems without a rewrite.

### TECHNICAL SKILLS

| AREA        | TECHNOLOGIES                                                                                     |
|-------------|--------------------------------------------------------------------------------------------------|
| Rust        | Tokio (async), Axum, Clap, Ratatui (TUI), Rayon (data parallelism), Serde                        |
| Interop     | PyO3 FFI (Rust↔Python), C ABI, static linking, single-binary distribution                        |
| Performance | zero-copy/zero-alloc hot paths, lock-free patterns, profiling, connection pooling, rate limiting |
| Correctness | type-driven design, property-based testing, strict Clippy, no unsafe                             |
| Domains     | network/security tooling, forensic analytics (20K tx/s, 50K addr/s), EVM bots (alloy)            |
| Desktop     | Tauri 2.0 (Rust backend + web frontend)                                                          |
| Adjacent    | Python, TypeScript, Solidity, SQL; Docker, GitHub Actions CI                                     |

### EXPERIENCE

**Independent Systems Engineer** — 2010 – Present · Stockholm

Architect and sole engineer on Rust-heavy systems across security, forensics, and DeFi; 5,700+ automated tests overall.

**Security Researcher (part-time)** — 2022 – Present · Immunefi / Sherlock / Code4rena · Remote

### SELECTED PROJECTS

**Ferox-Pro — 36-Crate Rust Security Platform** · Rust 2024 · Tokio · Tauri 2.0 · 782+ tests

- Enterprise workspace of 36 crates; async security engine with 20+ concurrent operations; Rayon-parallel memory forensics; release profile tuned (lto, codegen-units=1, strip); zero unsafe, strictest Clippy.

**BTC Sentinel — High-Throughput Forensic Engine** · Rust · Tokio · WebSocket · 111 tests

- Single statically-linked binary, zero runtime deps; **20,000 tx/s** pattern analysis, **50,000 addr/s** clustering (Union-Find + taint); type-safe Sats (u64) amounts; <1 ms wire-speed mempool detection; SOCKS5/Tor support.

**HuntLoan — MEV Liquidation Bot (Base mainnet)** · Rust 2024 · alloy v1 · deployed

- Built on modern alloy (not deprecated ethers-rs); HF velocity prediction (linear regression); 3-tier × 3-regime gas strategy; dual-shot parallel execution; circuit breaker.

**RentQ — Rust Core via PyO3** · *Rust* · *PyO3* · *Django* · 177 tests

- Embedded Rust eligibility engine in a Python service via PyO3: O(1) per entry (~0.5 ms) with parallel sorting — accelerating the hot path without rewriting the platform.

## EDUCATION

---

2010 Linköping University (SE) — SW Engineer equivalency · 2004 Paris 6 (FR) · 1999 Al-Azhar — technical engineering

## LANGUAGES

---

Arabic (native) · English (professional) · Swedish (working) · French (basic)
